Example 4: Solve the absolute value equation $\left| \frac{1}{2}x + 7 \right| = 25$. You may think that this problem is complex because of the $\frac{1}{2}$ next to the variable x . However, that shouldn't intimidate you because the key idea remains the same. We have the absolute value symbol isolated on one side and a positive number on the other.

Solve Absolute Value Inequalities with "Less Than" Let's look now at what happens when we have an absolute value inequality. Everything we've learned about solving inequalities still holds, but we must consider how the absolute value impacts our work. Again we will look at our definition of absolute value.

Solving an Absolute Value Equation. Recall that the absolute value of a real number $|a|$, denoted $\sqrt{|a|}$, is defined as the distance between zero (the origin) and the graph of that real number on the number line. For example, $\sqrt{|-3|} = 3$ and $\sqrt{|3|} = 3$. In addition, the absolute value of a real number can be defined algebraically as a piecewise function.

1.7 Absolute Value Equations and Inequalities ...

Solve for the negative version of the equation, in which you will first multiply the value on the other side of the equal sign by -1 , and then solve. In addition to the above steps, there are other important rules you should keep in mind when solving absolute value equations.

Solving Absolute Value Equations - Methods & Examples

Absolute value equations are equations where the variable is within an absolute value operator, like $|x-5|=9$. The challenge is that the absolute value of a number depends on the number's sign: if it's positive, it's equal to the number: $|9|=9$. If the number is negative, then the absolute value is its opposite: $|-9|=9$. So when we're dealing with a variable, we need to consider both cases.

Step 1 : Rearrange this Absolute Value Equation. Absolute value equality entered $|2x| + 1 = 7$ Another term is moved / added to the right hand side. $|2x| = 6$. Step 2 : Clear the Absolute Value Bars. Clear the absolute-value bars by splitting the equation into its two cases, one for the Positive case and the other for the Negative case.
